

Revolutionary web based software seamlessly centralises fleet management

Managing, monitoring and measuring the whole life cost of fleet vehicles can be a nightmare, with data for maintenance, fuel costs, depreciation and accidents being held in different places. This coupled with the pressures of risk management, and trying to reduce operational costs, its time to pull everything under one umbrella.

Jaama, a new breed technology company is passionate about the fleet industry and have quietly been revolutionising fleet management software by developing the worlds first next generation .Net2 Microsoft 'smart client' fleet and risk management system.

Since Jaama's launch in 2004, investment in web based software development has exceeded £4m and while Key2 Vehicle Management remains Jaama's core fleet system it has developed add-on specialist modules to enhance your vehicle management functionality in areas specific to your organisation such as workshops, short term hire, accounts, fuel management, commercial vehicle management and driver management to provide an exact match to your requirements and automate many core processes.

Jaama can help you manage everything from vehicle and asset acquisition, operation, repair and maintenance through to disposal.

Our systems also:

- Automatically checks your drivers licences with the DVLA ensuring all drivers have valid licences
- Provides you with a comprehensive 'duty of care' audit trail
- Saves you time by automating tasks and reporting by exception or on demand
- Notifies you of irregularities
- Controls and reduces your operating costs
- Saves you money through accurate asset management and control of variable costs
- Allocates operating costs departmentally
- Received, stores and retrieves VOSA compliant electronic documents and O licence management

MD Jason Francis, whose brainchild the company was, said: "The growth of Jaama has been on a completely different scale to the business plan we originally had.

"Growth has been fuelled by a combination of the software capability and the service and support we provide to customers. We continue to win a significant amount of business through referrals from existing clients."

Mr Francis said: "Our customers are very demanding, but we have risen to the challenge. As clients have looked to increase the depth of functionality we have further developed our modules to the point where Jaama is leading a technology revolution that links fleet operations to other internal systems such as HR and payroll, and external systems used by suppliers and customers."

Continuous software developments mean that Jaama has launched version three of its Key2 system, enabling increased integration, particularly customers with their suppliers.

Jaama is currently developing links

with third party systems further to enable organisations to conduct online business transactions such as P11d submissions with HM Revenue & Customs.

Mr Francis concluded: "When we launched the business four years ago we planned on bringing a market-leading web-based fleet, contract hire and rental management software solution to the marketplace. However, the functionality delivered by the Key2 product range has become far broader as a result of customers' requirements becoming increasingly complex.

"As corporate compliance requirements continue to increase, the challenge for Jaama is to develop our software to meet those demands and continue to reduce the administration burden for customers, while further aiding top-level decision making through technology."

Major customers include:

British Transport Police, BCA, Luton Borough Council, Hertfordshire County Council, DHL Express, DHL International, Manheim, SIG, Steria, Fleet Hire, Newton Vehicle Rentals, Phones 4U and Advantage Incident Management.

Jaama has brought for the first time fleet, leasing and rental software together with practical health and safety advice in one innovative solution.

Our award winning integrated systems enable fleet decision makers to monitor, measure, compare and contrast the performance of drivers and vehicles more effectively, control spiraling costs and proactively manage duty of care.
